java.util

## Class ArrayList<E>

### Method Summary

boolean	<a href="#">add(E o)</a>	Appends the specified element to the end of this ArrayList.
void	<a href="#">add(int index, E element)</a>	Inserts the specified element at the specified position in this ArrayList.
void	<a href="#">clear()</a>	Removes all of the elements from this ArrayList.
Object	<a href="#">clone()</a>	Returns a clone of this vector.
boolean	<a href="#">contains(Object elem)</a>	Tests if the specified object is a component in this vector.
E	<a href="#">get(int index)</a>	Returns the element at the specified index.
int	<a href="#">indexOf(Object elem)</a>	Searches for the first occurrence of the given argument, testing for equality using the equals method.
boolean	<a href="#">isEmpty()</a>	Tests if this vector has no components.
Iterator<E>	<a href="#">iterator()</a>	Returns an iterator over the elements in this list in proper sequence.
E	<a href="#">remove(int index)</a>	Removes the element at the specified position in this ArrayList.
boolean	<a href="#">remove(Object o)</a>	Removes the first occurrence of the specified element in this ArrayList If the ArrayList does not contain the element, it is unchanged.
protected void	<a href="#">removeRange(int fromIndex, int toIndex)</a>	Removes from this List all of the elements whose index is between fromIndex, inclusive and toIndex, exclusive.
void	<a href="#">set(E obj, int index)</a>	Sets the element at the specified index of this vector to be the specified object.
int	<a href="#">size()</a>	Returns the number of components in this vector.
Object[]	<a href="#">toArray()</a>	Returns an array containing all of the elements in this ArrayList in the correct order.
void	<a href="#">trimToSize()</a>	Trims the capacity of this vector to be the vector's current size.

java.util

## Class HashSet<E>

### Method Summary

boolean	<a href="#">add(E o)</a>	Adds the specified element to this set if it is not already present.
void	<a href="#">clear()</a>	Removes all of the elements from this set.
Object	<a href="#">clone()</a>	Returns a shallow copy of this HashSet instance: the elements themselves are not cloned.
boolean	<a href="#">contains(Object o)</a>	Returns true if this set contains the specified element.
boolean	<a href="#">isEmpty()</a>	Returns true if this set contains no elements.
Iterator<E>	<a href="#">iterator()</a>	Returns an iterator over the elements in this set.
boolean	<a href="#">remove(Object o)</a>	Removes the specified element from this set if it is present.
int	<a href="#">size()</a>	Returns the number of elements in this set (its cardinality).

java.util

## Class HashMap<K,V>

### Method Summary

void	<a href="#">clear()</a>	Removes all mappings from this map.
Object	<a href="#">clone()</a>	Returns a shallow copy of this HashMap instance: the keys and values themselves are not cloned.
boolean	<a href="#">containsKey(Object key)</a>	Returns true if this map contains a mapping for the specified key.
boolean	<a href="#">containsValue(Object value)</a>	Returns true if this map maps one or more keys to the specified value.
V	<a href="#">get(Object key)</a>	Returns the value to which the specified key is mapped in this identity hash map, or null if the map contains no mapping for this key.
boolean	<a href="#">isEmpty()</a>	Returns true if this map contains no key-value mappings.
Set<K>	<a href="#">keySet()</a>	Returns a set view of the keys contained in this map.
V	<a href="#">put(K key, V value)</a>	Associates the specified value with the specified key in this map.
V	<a href="#">remove(Object key)</a>	Removes the mapping for this key from this map if present.
int	<a href="#">size()</a>	Returns the number of key-value mappings in this map.

## Interface Iterator<E>

### Method Summary

boolean	<a href="#">hasNext()</a>	Returns <code>true</code> if the iteration has more elements.
E	<a href="#">next()</a>	Returns the next element in the iteration.
void	<a href="#">remove()</a>	Removes from the underlying collection the last element returned by the iterator (optional operation).
