Contents

CATALOG DESCRIPTION. An introduction to algorithmic efficiency and to techniques for the design and analysis of efficient algorithms. General topics include review of asymptotics, algorithm design techniques (such as divide-and-conquer, dynamic programming, and greedy algorithms), graph algorithms, languages and automata, and NP-completeness.

TEXTBOOKS.

Cormen et al. *Introduction to Algorithms*, third edition, McGraw Hill / MIT Press, 2009. (See the course website for a link to solutions to some of the problems as found on the book's official website and a link to lectures by one of the book's authors from a class similar to ours.)

Lewis and Papadimitriou. *Elements of the Theory of Computation*, second edition, Prentice Hall, 1998. (The department owns copies for students to borrow.)

OBJECTIVES. The outcomes of this course fall under four headings: skills in the *analysis* of algorithms, *literacy* in well-known algorithms and data structures, skills in *devising and implementing* algorithms, and understanding of problems and results in *computational complexity*. In detail, at the end of this course students should be able to

- analyze the time complexity of algorithms
 - using worst-case and expected-case analysis
 - using recurrences and substitution
 - using the master method
 - using amortized analysis
 - using rigorous experimental methods
- identify, articulate, and adapt algorithms and data structures
 - from classical problems such as sorting and searching
 - from a variety of topics chosen by the instructor after considering students' interests
- devise and implement advanced algorithms

The other three goals are linked to the three units of the course, but this goal improving students' algorithm-writing ability—will be pursued and assessed throughout the semester.

- identify and categorize intractable problems
 - in articulating and using the tools of formal languages and automata
 - in articulating the nature of computability
 - in articulating the nature of \mathcal{NP} -completeness

- in proving problems to be \mathcal{NP} -hard and \mathcal{NP} -complete
- in finding approximate solutions to \mathcal{NP} -complete problems

OUTLINE. This course is organized under the following units:

- **Core material.** We study and practice the basic and advanced tools of understanding, composing, and analyzing algorithms.
 - We review topics of algorithm analysis and correctness proof that students have seen in previous courses and make students' skills in these areas stronger and more rigorous.
 - We learn analysis concepts and strategies such as asymptotics and complexity classes (big-theta, etc), recurrences and substitution, the master method, and amortized analysis.
 - We learn algorithmic strategies such as divde and conquer, dynamic programming, and greedy algorithms
 - We study sorting algorithms at a level of rigor beyond those in earlier courses; some ideas of computational complexity are anticipated as we consider the lower bound for complexity of comparison-based sorting.
- **Topical material.** The course will include a variety of specific algorithmic topics, some to be studied in-class, some to be worked on by students as large out-of-class assignments. See below for details. Topics are drawn from
 - Hash tables
 - Red-black trees
 - B-trees
 - Fibonacci heaps
 - Disjoint sets
 - Introductory graph theory and algorithms
 - Minimum spanning trees
 - Single-soure shortest paths
 - All-pairs shortes paths
 - Maximum flow
 - Linear programming
 - Fast Fourier transform
 - String matching
 - Computational geometry

Computational complexity. This course plays a second duty: it provides advanced coverage of the theory of computation. Specifically

- A review of formal languages and automata
- Turing machines
- Undecidability
- Computational complexity; \mathcal{P} vs \mathcal{NP}
- \mathcal{NP} -completeness, including reductions, and approximation algorithms.

For a schedule, see the course website.

Course procedures

How WE DO THIS COURSE. Of the courses I teach, this is the most textbook-dependent (besides a course for which I wrote the textbook) and the least lecture-oriented. Class time is used more for collaborative practice than for presentation of new material.

For most class periods, students will have a textbook reading and practice problems; in class we will clarify points in the readings, review solutions to practice problems, and work together on new problems. Students will have more serious problems sets (for turn-in and grading) about every week-and-a-half. Students will have two pair projects (see below) during the course of the semester. There will be three mostly-noncumulative tests (two held during class time, the last during the exam block).

PROBLEM SETS. The bulk of the work in this course will be pencil-and-paper problem sets. You are permitted to work together to a reasonable extent. If you work with another person or two, be your own judge that you are making a grade-worthy contribution and receiving the full benefit of the exercise. Some problems sets may include the implementation of an algorithm.

Students who expect to do further academic work in computer science (or math, physics, or economics) are encourgaged to typeset their solutions to problem sets using $\mathbb{M}_{E}X$. The instructor will happily provide personal assistance and other resources to students wanting help learning $\mathbb{M}_{E}X$.

TOPICS AND PAIR PROJECTS. Of the topics listed under "Topical material" in the course outline, five or so will be chosen as class-topics in the middle third of the course. Each student will study two others as pair projects.

In the first two weeks of the semester, each student should email the instructor his or her preferences among the fourteen listed available topics. The instructor will then choose five (or so) topics to include in the topical unit. (Note that the survey of student interest is for the instructor's information only; the instructor retains sole discretion over the final choice of topics.)

After the in-class topics are chosen, students will choose two other topics to study as projects. The projects will consist in a portion of the relevant chapter in CLRS, a set of problems, and an implementation, decided by the instructor in consultation with the students. Students will work in pairs; each student will have a different partner for each project. The projects are officially due on the last day of class (Friday, Dec 14), but students are strongly encouraged to set earler due dates for themselves and to spread the work judiciously throughout the semester.

COURSE NOTEBOOK. Please obtain a notebook to use for daily work and in-class problems. Please keep it presentable so that the instructor can inspect it for evaluating daily work and so that your classmates can see your work in it for collaboration.

GRADING. There will be three mostly-noncumulative tests (scheduled for classtime Oct 3, classtime Oct 31, and the final exam block, Thursday, Dec 18, 10:30 am).

instrument	weight
Test 1	15
Test 2	15
Test 3	15
Team topic (project) 1	10
Team topic (project) 2	10
Problem sets	30
Participation/daily work	5

Note that test 3, held during the final exam block, is not worth more than the other two tests. The heavy weight given to problem sets reflects how they demand most of the work in this course.

Policies etc

ACADEMIC INTEGRITY. Collaboration among students in the class is permitted on most assignments. Many problems you will be assigned are discussed or solved in the computer science literature or on the Internet. Use of these resources for graded work (that is, problem sets and team projects, as opposed to daily work) is discouraged, and if they are ever used, full citation must be given, just as in a research paper. *Use of any resources that specifically serve as solutions to exercises in Cormen et al is not permitted.* (One exception: Solutions posted on the website that accompanies the textbook may be used to check answers for daily work; I will not assign any problems in the problem sets that have solutions posted there.)

Assignments. Graded homework (problem sets and team projects) will not be accepted late. If an assignment is not complete by the deadline, turn in what you have at that time for partial credit.

ATTENDANCE. Students are expected to attend all class periods. It is courtesy to inform the instructor when a class must be missed.

EXAMINATIONS. Students are expected to take all tests, quizzes, and exams as scheduled. In the case where a test must be missed because of legitimate travel or other activities, a student should notify the instructor no later than one week ahead of time and request an alternate time to take the test. In the case of illness or other emergency preventing a student from taking a test as scheduled, the student should notify the instructor as soon as possible, and the instructor will make a reasonable accomodation for the student. The instructor is under no obligation to give any credit to students for tests to which they fail to show up without prior arrangement or notification in non-emergency situations. Although the final exam block (Thursday, Dec 18, 10:30 AM) is used for an assessment instrument similar to other tests, final-exam rules apply: I do not allow students to take finals early (which is also the college's policy), so make appropriate travel arrangements.

SPECIAL NEEDS. *Institutional boilerplate:* Wheaton College is committed to providing reasonable accommodations for students with disabilities. Any student with a documented disability needing academic adjustments is requested to contact the Academic and Disability Services Office as early in the semester as possible. Please call 630.752.5941 or send an e-mail to jennifer.nicodem@wheaton.edu for further information.

GENDER-INCLUSIVE LANGUAGE. The college requires the following statement to be included on all syllabi: For academic discourse, spoken and written, the faculty expects students to use gender inclusive language for human beings.

OFFICE HOURS. I try to keep a balance: Stop by anytime, but prefer my scheduled office hours. Any time my door is closed, it means I'm doing something uninterruptible, such as making an important phone call. Do not bother knocking; instead, come back in a few minutes or send me an email. Be aware that this semester on MWF I teach three course, 12:45–4:20, so I will not be available during what is often a popular office-hour time.

DRESS AND DEPORTMENT. Please dress in a way that shows you take class seriously—more like a job than a slumber party. (If you need to wear athletic clothes because of activities before or after class, that's ok, but try to make yourself as professional-looking as possible.) If you must eat during class (for schedule or health reasons), please let the instructor know ahead of time; we will talk about how to minimize the distraction.

ELECTRONIC DEVICES. Please keep laptops and all electronic devices put away and silenced during class. (That's right, this is a computer science course, but you're not allowed to use a computer during class. Trying out programming concepts on your own during class time (for example) is not productive because it takes you away from class discussion. You cannot multitask as well as you think you can.) *Text in class and DIE.*
