Outline of POS/HMM unit:

- The POS-tagging problem
- Hidden Markov Models definition
- HMM Problem 1 and the forward algorithm
- ▶ HMM Problem 2 and the Viterbi algorithm, applied to POS-tagging
- ► HMM Problem 3 and the Baum-Welch algorithm, with other linguistic applications

Many languages, including English, divide common nouns into count nouns and mass nouns. Count nouns can occur in the singular and plural and can be counted. Mass nouns are used when something is conceptualized as a homogenous group. So *snow*, *salt*, and *communism* are not counted (i.e., **two snows* or **two communisms*). J&M p 149

Karl Marx and Josef Stalin represent two very different communisms.

Nouns can be used attributively:

There is of course nothing new in putting a noun to this use when no convenient adjective is available; examples abound in everyday speech—government department, nursery school, television set, test match, and innumerable others. But the noun-adjective, useful in its proper place, is now running riot and corrupting the language. H.W. Fowler, Modern English Usage

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Adjectives can be used substantively:

Do not let the **perfect** be the enemy of the **good**.

Word classes

Linguists group the words of a language into classes (sets) which show similar syntactic behavior, and often a typical semantic type. These word classes are otherwise called **syntactic** or **grammatical categories**, but more commonly still by the traditional name **parts of speech** (POS). Three important parts of speech are **noun**, **verb**, and **adjective**. ... The most basic test for words belonging to the same class is the **substitution test**. Adjectives can be picked out as words that occur in the frame:

$$The \left\{ \begin{array}{c} sad \\ intelligent \\ green \\ fat \\ \dots \end{array} \right\} one is in the corner$$

Manning and Schütze, Foundations of Statistical NLP, pg 81
