Which of the following are true?

$$
\begin{aligned}
(x + y) + z &= x + (y + z) \\
(x - y) + z &= x - (y + z) \\
(p \vee q) \vee r &\equiv p \vee (q \vee r) \\
(p \vee q) \wedge r &\equiv p \vee (q \wedge r)
\end{aligned}
$$

1. Write a function `leastSigDigs` that takes a list of ints and returns a list of the least significant digits in those lists. For example, `leastSigDigs[283, 7234, 5, 2380]` would return `[3, 4, 5, 0]`.

2. Write a function `hasEmpty` that takes a list of lists (of any type) and determines whether or not the list of lists contains an empty list. For example, `hasEmpty([[1,2,3], [4,5], [], [6,7]])` would return `true`.
