

Chapter 8, Strings:

- ▶ General introduction; string sorting (last week Friday)
- ▶ Tries (**Today**)
- ▶ Other string topics (Wednesday)
 - ▶ Regular expressions
 - ▶ Huffman encoding
 - ▶ Edit distance
 - ▶ Grammars and parsing
- ▶ Review for Tests 3 and 4 (next week Friday)

Today:

- ▶ Problem statement
- ▶ Main idea behind tries
- ▶ Code details:
 - ▶ Node class
 - ▶ Find
 - ▶ Insertion
 - ▶ Deletion

Coming up (the last):

Catch up on old projects . . .

*Do **Perfect Hashing** project (due today, Monday, Dec 9)*

*Do **Trie** project (due Friday, Dec 13)*

Due Today, Mon, Dec 9

Read Section 8.2

End-of-semester important dates

- ▶ Mon, Dec 9: Last project assigned
- ▶ Tues, Dec 10: Last “normal” running of project grading script
- ▶ Wed, Dec 11: Test 3 & 4 Review sheet distributed, Test 4 practice problems made available.
- ▶ Thurs, Dec 12: Review lab (pick practice problems for Test 4)
- ▶ Fri, Dec 13, AM: “Two-minute warning” running of project grading script (Canvas gradebook will not be updated—see project report in your turn-in file)
Note that Fri, Dec 13 is the Last Day of Classes.
- ▶ Fri, Dec 13, midnight: Official project deadline
- ▶ Sat, Dec 14, when I wake up: Permissions to turn-in folders turned off
- ▶ Mon, Dec 16: Project grading script run for final/semester grades
- ▶ Wed, Dec 18, 10:30am-12:30pm: Tests 3 and 4 (in lab)
 - ▶ Test 3: On paper (like Test 1) covering BSTs (ch 5), DP (Ch 6), hashables (Ch 7) and strings (ch 8).
 - ▶ Test 4: At a computer (like Test 2) covering DP (Ch 6), hashables (Ch 7) and strings (ch 8).

In class and in the text, we see an **iterative** implementation of tries.

In the accompanying project, you'll implement the trie operations
recursively in the node.

```
public class LinkedList {
    class Node {
        int datum;
        Node next;
    }

    Node root;

    public boolean contains(int item) {
        boolean found = false;
        for (Node current = root;
            ! found and current != null;
            current = current.next)
            found = current.datum == item;
        return found;
    }
}
```

```
public class LinkedList {
    class Node {
        int datum;
        int next;
        boolean contains(int item) {
            if (item == datum) return true;
            else if (next == null) return false;
            else return next.contains(item);
        }

        Node root;

        public boolean contains(int item) {
            if (root == null) return false;
            else return root.contains(item);
        }
    }
}
```

Invariant 39. [Class invariant of `TrieMap`]

- (a) For all nodes, the path to that node is a prefix to at least one key in the map.
- (b) For all nodes, the node is terminal iff the path to that node is a key in the map.

In class and in the text, we see an **iterative** implementation of tries.

In the accompanying project, you'll implement the trie operations **recursively in the node**.

```
public class LinkedList {
    class Node {
        int datum;
        Node next;
    }

    Node root;

    public boolean contains(int item) {
        boolean found = false;
        for (Node current = root;
            ! found and current != null;
            current = current.next)
            found = current.datum == item;
        return found;
    }
}
```

```
public class LinkedList {
    class Node {
        int datum;
        int next;
        boolean contains(int item) {
            if (item == datum) return true;
            else if (next == null) return false;
            else return next.contains(item);
        }

        Node root;

        public boolean contains(int item) {
            if (root == null) return false;
            else return root.contains(item);
        }
    }
}
```
