Chapter 3, Case Studies:

- Linear-time sorting algorithms (Monday and Wednesday)
- Disjoint sets and array forests (Today)
- Priority queues (Next week Monday)
- N-sets and bit vectors (Next week Wednesday)

Today:

- Problem statement
- Disjoint set ADT details
- The array forest abstraction and data structure

Find and union strategies, with optimizations

Problem statement:

Suppose we have a collection of items connected by an unknown equivalence relation. Efficiently find the equivalence classes in this collection as information about the relation is discovered.

The disjoint set ADT:

Main operations: union two sets, find a set for a given element, and test if two elements are in the same set.

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

- The universe is closed.
- We assume all elements can be indexed, [0, N).
- A set in the partition is identified by a leader.

## Invariant (Class ArrayForestDisjointSet)

For all  $i \in [0, n)$ ,

- (a) leader(i) = leader(parents(i)), that is, id(i) points to another element in the same set as *i*.
- (b) leader(i) = parents[leader(i)], that is, leaders all point to themselves.
- (c) Following a finite number links implied by parents will converge, that is, there is no circularity in the tree.

**Coming up:** (all end-of-day)

Do linear sorting project (suggested by Mon, Feb 7)

Due **Today**: Finish reading Section 3.2 (disjoint sets and array forests) Take disjoint-sets quiz

▲ロト ▲圖ト ▲画ト ▲画ト 三回 - のへで

Due Mon, Feb 7: Read Section 3.3 (heaps and priority queues)

Due **Wed, Feb 9**: Take heap/pq quiz

Due **Thurs, Feb 10**: Read Section 3.4 Do Exercises 3.(27 & 28). Take N-sets quiz
